

EVA-150

The packaging rewinder is a great help for the disposal of the stiff, heavy packaging of paper rolls.

Wrapping Remover

This machine is located immediately behind the unpacking station. It comprises the feed conveyor with belts, a roller brush, the winder unit and the flattening station.

shaft. When the entire outer wrapping is removed and wound, it is ejected from the winding shaft by means of a pusher. The flattened, wound objects are then collected in the waste container.

Function sequence

The operator cuts open the outer wrapping; one end falls on to the feed conveyor and is seized by roller brush. The outer wrapping is now pulled from the roll and guided to the winder. This seizes the incoming web and winds it on to the winding
